Important information

Limitation of liability

This product has been designed to meet the requirements of NFPA Standard 72, 1999 Edition; Underwriters Laboratories, Inc., Standard 864, 8th Edition; and Underwriters Laboratories of Canada, Inc., Standard ULC S527. Installation in accordance with this manual, applicable codes, and the instructions of the authority having jurisdiction (AHJ) is mandatory. EST shall not under any circumstances be liable for any incidental or consequential damages arising from loss of property or other damages or losses owing to the failure of EST products beyond the cost of repair or replacement of any defective products. EST reserves the right to make product improvements and change product specifications at any time.

While every precaution has been taken during the preparation of this manual to ensure the accuracy of its contents, EST assumes no responsibility for errors or omissions.

FCC warning

This equipment can generate and radiate radio frequency energy. If this equipment is not installed in accordance with this manual, it may cause interference to radio communications. This equipment has been tested and found to comply within the limits for Class B computing devices pursuant to Subpart B of Part 15 of the FCC Rules. These rules are designed to provide reasonable protection against such interference when this equipment is operated in a commercial environment. Operation of this equipment is likely to cause interference, in which case the user at his own expense, will be required to take whatever measures may be required to correct the interference.
Locating related documents

**EST2 documentation**

A library of related documents supports the EST2 product line. Here is a complete list of the EST2 library:

**Signature Series documentation**

The *Signature Series Intelligent Smoke and Heat Detectors Applications Bulletin* (P/N 270145) provides instructions and illustrations for various arrays of smoke and heat detectors.

The *Signature Series Component Installation Manual* (P/N 270497) supports the installation of the Signature Series detectors and modules.

The *Serial Number Log Book* (P/N 270267) provides a convenient means for recording the serial number of each Signature device installed in the fire alarm system.

**Speaker and strobe documentation**

The *EST Speaker Application Guide* (P/N 85000-0033) provides information about the placement and layout of speakers for fire alarm signaling and emergency voice communications.

The *EST Strobe Applications Guide* (P/N 85000-0049) provides information for the placement and layout of strobes for fire alarm signaling.
Installation codes and standards

The Signature Series fire detection devices are designed to meet the requirements of NFPA Standard 72, 1999 Edition; Underwriters Laboratories, Inc. Standard 864, 8th Edition and Underwriters Laboratories of Canada, Inc. Standard ULC S527. Other related codes and standards are listed below. Information contained in this document is intended to serve as a guide. Installation in accordance with the instruction sheets (provided with Signature Series devices), applicable codes, and the instructions of the AHJ is mandatory.

Documentation conventions

Notices throughout this manual inform the reader of practices and conditions, which will affect physical safety, occupant safety, equipment performance, and efficiency. Notices appear as warnings, cautions, and notes.

Warnings

Warnings appear whenever property damage, injury, or loss of life may occur through the neglect of safe practices and conditions. You will see warnings in the following format:

Warning! Disconnect all wiring on TB4 of the SIGA-REL (release circuits 1 and 2) during system service. Disabled points will not prevent activation of the release circuits. Failure to follow these instructions may result in loss of life, serious injury, or property damage.

Cautions

Cautions alert you to practices that may damage equipment, software, or project databases. For example, the manual provides a caution against corrupting the database.

Caution! Do not use the Accept Actual function in the Signature Mapping tool. Accepting actual data may corrupt the database by causing it to see every accepted device as two devices.

Notes

Notes provide instructions to help you save time or avoid wasting it. For example, a note may inform you that a system does not support a function so you will not waste time looking for it.

Note: EST2 systems do not support matrix groups.
Chapter 1

Installing the SIGA-REL

Summary
The SIGA-REL supports a variety of fire suppression applications. These applications include sprinkler systems and automatic fire extinguishing systems. When you install the SIGA-REL, follow agency and local requirements along with the instructions in this manual.

Introducing the SIGA-REL

Description

The SIGA-REL Releasing Module (Figure 1-1) is a Signature Series component consisting of:

- Two supervised release circuits
- Two supervised prerelease circuits
- One supervised manual release input circuit
- One supervised abort circuit for a normally-open abort switch
- One first alarm output relay (Form C contact)

The SIGA-REL controls operations for deluge, preaction, and automatic fire extinguishing systems. The module controls the release of gas and other fire suppression agents through release solenoids.

Features

The SIGA-REL includes:

- Deluge sprinkler operation
- Preaction sprinkler operation
- Automatic fire extinguishing operation
- Selectable abort modes
- Intelligent microprocessor
Fire suppression systems

Sprinkler systems

The SIGA-REL works with two types of sprinkler systems: deluge and preaction. The primary difference between both systems is the type of sprinkler head (or nozzle) that terminates the pipes. Table 1-1 outlines the Factory Mutual Research Corporation (FMRC) requirements for deluge and preaction systems. FMRC also requires FM-approved compatible release valves. See Table 1-4 in Compatible panels and devices.

Table 1-1: FM approval requirements for deluge and preaction sprinkler systems

<td>Class A (Style D or E) or Class A (Style 2, 5, 6, or 7)</td>
</tr>
</tbody>
</table>

Deluge sprinkler systems

In Deluge sprinkler systems, open-valve sprinkler heads terminate pipes connected to a water supply controlled by a single valve. When the system detects a fire it automatically opens the valve to allow the waterflow through all of the sprinkler heads. Deluge sprinklers are useful for applications that require the simultaneous discharge of water through every sprinkler.

The following fire detection systems meet FRMC requirements for deluge systems:

- Wet pilot sprinkler line
- Dry pilot sprinkler line
- Hydraulic rate-of-rise
- Pneumatic rate-of-rise
- Electric

Preaction sprinkler systems

In preaction sprinkler systems, closed-valve sprinkler heads terminate pipes connected directly to a water supply. The water supply is usually in the same area as the sprinklers and the pipes are supervised for air pressure. Preaction sprinklers are useful where it is important to prevent the accidental discharge of water.

The following fire detection systems meet FRMC requirements for preaction systems:

- Hydraulic rate-of-rise
- Pneumatic rate-of-rise
- Electric
Automatic fire extinguishing systems

**Warning!** Improper applications of fire suppression agents can lead to property damage, injury, or loss of life. Consult the applicable NFPA documents and the authority having jurisdiction (AHJ) for more information.

Automatic fire extinguishing systems automatically detect and extinguish fires. They require no manual input because detectors automatically activate releasing solenoids or sprinkler valves. Table 1-2 provides a list of the fire suppression agents and the applicable NFPA documents.

Installing the SIGA-REL

Compatible panels and devices

Panels
The SIGA-REL is compatible with EST2 and EST3 fire alarm control panels. You may install the SIGA-REL in any of the following enclosures:

• 2-WB(X) series
• RACCR series
• 3-RCC series
• 3-CAB series
• MFC-A

Note: Maintain a 1-inch (25.4 mm) minimum clearance all around the SIGA-REL. The clearance space must also comply with the National Electrical Code.

Power supplies
The SIGA-REL is compatible with the following power supplies:

• 2-PPS(-220)
• 2-PPS/6A(-220)
• SIGA-APS(-220)
• 3-BPS/M(-220)
• 3-PPS/M(-220)
• BPS6(-220)*
• BPS10(-220)*

*Not compatible with FMRC sprinkler applications that require 90 hours of standby.

Solenoid polarizing relays
Use the RELA-EOL with the SIGA-REL. For more information, see the RELA-EOL installation sheet.

Abort stations
The SIGA-REL is only compatible with normally-open, momentary-action abort stations. Abort stations must be listed with the appropriate agencies in your area. See Listing agencies.

Service disconnect stations
The SIGA-REL is only compatible with listed service disconnect stations that are normally-closed (minimum 2.0 Amps). Service disconnect stations must be listed with the appropriate agencies in your area. See Listing agencies.
Releasing solenoid valves

Releasing solenoid valves must be listed with the appropriate agencies in your area. FMRC requires FM-approved solenoid release valves. Table 1-4 lists the FM-approved solenoid release valves that work with the Releasing Module.

Table 1-4: FM-approved solenoid release valves

For other listing agencies that may apply to your area, see Listing agencies.

Listing agencies

Listing agencies include:

- Factory Mutual Research Corporation (FMRC)
- Underwriters Laboratories, Inc. (UL)
- Underwriters Laboratories Canada (ULC)
Specifications

*Riser current: Total current of output circuits is limited to the power riser input current (up to 4 amps) minus 170 mA.

Power riser

- Input voltage: 24 Vdc
- Supervisory current: 25 mA, max.
- Alarm current: 170 mA min., 4 A max. (depends on output circuit loading)
- Line resistance: See Table 1-5.

Release circuits, TB4

- Output (release circuit 1): 2 A @ 24 Vdc, max. (*See riser current.) TB4-1 and TB4-2
- Output (release circuit 2): 2 A @ 24 Vdc, max. (*See riser current.) TB4-3 and TB4-4
- Valves per circuit: 4 valves, max.
- Line resistance: See Table 1-6.
- End of line device: 47 kΩ resistor

Prerelease circuits, TB5

- Output (prerelease circuit 1): 2 A @ 24 Vdc, max. (*See riser current.) TB5-1 and TB5-2
- Output (prerelease circuit 2): 2 A @ 24 Vdc, max. (*See riser current.) TB5-3 and TB5-4
- Line resistance: See Table 1-6.
- End of line device: 47 kΩ resistor

Manual release input circuit, TB3-1 and TB3-2

- Line resistance: 25 Ω/wire, #18 AWG = 3800 ft (0.75 mm² = 1158 m)
- End of line device: 47 kΩ resistor
- Circuit capacitance: 0.1 μF, max.

Abort circuit, TB3-3 and TB3-4

- Line resistance: 25 Ω/wire, #18 AWG = 3800 ft (0.75 mm² = 1158 m)
- End of line device: 47 kΩ resistor
- Circuit capacitance: 0.1 μF, max.

First alarm contact, TB2

- Contact rating: 3 A @ 24 Vdc, (resistive load) Form C

Signature Data line, TB1

- Operating voltage: 15.2 to 19.95 Vdc
- Supervisory current: 1 mA
- Alarm current: 1 mA
- Line resistance: See the installation sheet of the Signature loop controller.
- Maximum quantity: Ten SIGA-RELs per loop
Installing the SIGA-REL

Environmental conditions

- Operating temperature: 32 to 120°F (0 to 49°C)
- Storage temperature: -4 to 140°F (-20 to 60°C)
- Humidity: 0 to 93% RH, non-condensing

Mounting the SIGA-REL

**Caution!** The SIGA-REL and the MFC-A require separation between power-limited and nonpower-limited wiring. See the MFC-A installation sheet for details about power-limited wiring in that enclosure. See *Wiring the SIGA-REL* for details about power-limited wiring on the SIGA-REL.

**To mount the SIGA-REL to the MFC-A:**

1. Align the SIGA-REL to the designated mounting holes in the MFC-A (Figure 1-2 and Figure 1-3).
2. Secure the SIGA-REL to the MFC-A with the washers and screws provided.
3. Run the wiring from the SIGA-REL to the fire suppression components through the conduit knockouts in the MFC-A.

![Figure 1-2: Mounting the SIGA-REL](RELEASE025.CDR)

**To mount the SIGA-REL in other enclosures:**

1. Use the SIGA-REL to mark the mounting hole locations (Figure 1-4).
2. Drill the mounting holes at the marks made in step 1 (mounting hole diameter = 0.125 in or 3.175 mm).
3. Mount the SIGA-REL in the cabinet with the screws and washers provided.
Installing the SIGA-REL

Figure 1-3: MFC-A/SIGA-REL footprint

Figure 1-4: SIGA-REL mounting holes in compatible cabinets

Notes

[1] Mark the mounting hole locations here.

2 See compatible enclosure installation sheets for the routing of power-limited and nonpower-limited wiring.
Setting abort mode and delay times

Choosing the abort mode

Table 1-7 provides descriptions for the SIGA-REL abort modes.

**Note:** Abort modes 3 and 4 do not comply with UL or ULC.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 (Factory default)</td>
<td>If the abort is initiated before the automatic delay timer expires, it will prevent the releasing action. The automatic delay timer will continue to run while the abort is active. When the abort is restored, the release will occur with the expiration of the automatic delay timer or the abort delay timer, whichever occurs last.</td>
</tr>
<tr>
<td>2</td>
<td>If the abort is initiated before the automatic delay timer expires, it will prevent the releasing action. The automatic delay timer will stop running. When the abort is restored, the automatic delay timer will resume and the release will occur with the expiration of the timer.</td>
</tr>
<tr>
<td>3 (Industrial Risk Insurers)</td>
<td>To be recognized as valid, the abort must be active when the second alarm is received. When the abort is restored, the release will occur with the expiration of the abort delay timer (set for 10 sec). If the valid abort is held for more than 10 seconds, the automatic delay timer is inactive. If the valid abort is held for less than 10 seconds, the automatic delay timer operates as programmed.</td>
</tr>
<tr>
<td>4 (International)</td>
<td>If the abort is initiated before the automatic delay timer expires, it will prevent the releasing action. The automatic delay timer will stop running. When the abort is restored, the automatic delay timer will reset and commence time from t = 0. The release will occur with the expiration of the timer setting minus 10 seconds.</td>
</tr>
</tbody>
</table>

Setting the DIP switches

**Warning!** Press the Reset switch at the fire alarm control panel whenever you change the DIP switch settings. Otherwise, the new settings will not take effect.

Figure 1-5 shows the default DIP switch settings of the SIGA-REL. Tables 1-8 through 1-11 provide the DIP switch settings for the SIGA-REL abort modes and delay time settings.

Wiring the SIGA-REL

Observing equipment and personal safety

To ensure safety with the SIGA-REL:

1. Copy Figure 1-7.
2. Cut out the photocopied warning along the perforated line.
3. Post the warning next to the SIGA-REL.
4. Inform all appropriate personnel about the posted warning, its location, and its importance.
5. Require compliance with the warning during all installation and service procedures.

Warning! Observe static-sensitive material handling practices while installing or servicing the SIGA-REL. Electrostatic discharge may damage the equipment and activate the release circuits.

Running the wires

Wire SIGA-REL according to Figure 1-8.
Disconnect all wiring on TB4 of the Releasing Module (release circuits 1 and 2) during system service. Disabled points will not prevent activation of the release circuits. Failure to follow these instructions may result in loss of life, serious injury, or property damage.

Notes

[1] Four RELA-EOLs per circuit, max.
[3] Class B, normally-open manual release station
[4] Class B, normally-open abort station
[5] Listed 47 kΩ EOL resistor
[8] Supervised and power-limited.
[9] Power-limited when connected to a power-limited source. If nonpower-limited, maintain 1/4 inch (6.4 mm) separation. Otherwise, use FPL, FPLR, or FPLP in accordance with the National Electric Code (NEC). Destroy power-limited markings.
[10] Listed service disconnect station
[11] Not included in preaction or deluge sprinkler systems
[12] Ten Releasing Modules per loop, max.

13 Installations, which include other wiring, require FPL, FPLR, FPLP, or equivalent NEC-approved wiring for all power-limited wiring.
Chapter 2

Programming the SIGA-REL

Summary

The SIGA-REL works with EST2 and EST3 systems. The 2-SDU and the 3-SDU (Revision 1.5) recognize the SIGA-REL as three SIGA-UM modules that occupy six addresses. The 3-SDU (Revision 2.0) does not require you to select SIGA-UMs because it recognizes the SIGA-REL.

In all systems, the programming procedures for the SIGA-REL are almost identical. The greatest differences exist in the required rules and the configuration of AND groups. The SIGA-REL programming steps require strict adherence. Follow each instruction carefully.

Programming the SIGA-REL in the 2-SDU

Adding the SIGA-REL to the database

**Warning!** This information was prepared for users who are proficient in every aspect of 2-SDU programming. DO NOT attempt to program the SIGA-REL if your certification is not current. Failure to do this may result in loss of life, serious injury, or property damage.

**Caution!** If you are adding other Signature Series devices to the project database, add the SIGA-REL last. Adding devices after the SIGA-REL may disrupt the addressing scheme. The SIGA-REL is a single module with six serial numbers, but the 2-SDU recognizes it as three SIGA-UMs. Addresses will differ for each installation, but they must be consecutive.

The SIGA-REL provides only one serial number label. When you scan in the SIGA-REL, only the first two serial numbers will appear in the database.

**To add the SIGA-REL to the database:**

1. Scan in the SIGA-REL serial number label.
2. In the SDC Configuration, ensure that four blank addresses follow the first two addresses.
3. Add two more SIGA-UMs (four address spaces) to the database to fill in the four empty addresses.
4. In the Signature Series mapping tool, access the Actual vs. Expected Data dialog box (F9 key).
5. Click Break Chain and select the appropriate address.
6. Commit the expected data.
7. In the SDC Configuration, configure the SIGA-REL (SIGA-UM) addresses in strict accordance with Tables 2-1 and 2-2.
Caution! Do not use the Accept Actual function in the Signature Mapping tool. Accepted data may corrupt the database by causing it to see every device as two devices.

Warning! DO NOT configure the third and fifth SIGA-UM addresses as common outputs or audio amplifiers. Any off-normal condition will activate the automatic release sequence if these addresses are common outputs. The Drill switch will activate the prerelease and the release circuits if they are audio amplifiers. You must select the device types and personality codes exactly as prescribed in Tables 2-1 and 2-2.

<td>0</td>
<td>No personality</td>
</tr>
</tbody>
</table>

*Actual addresses in your system may differ, but they must be consecutive. Serial numbers must also be consecutive up to the second-to-last digit.

**Select one of the following: DamperControl, DoorControl, or FanControl. Ensure that the selected device type is exclusive for SIGA-REL use.
Labeling the SIGA-REL components

In the Object Configuration, assign the labels and messages listed in Table 2-3 to the SIGA-UM.

<table>
<thead>
<tr>
<th>Device Type</th>
<th>Typical address</th>
<th>Label</th>
<th>Message</th>
<th>Model</th>
</tr>
</thead>

<td>0212*</td>
<td>Prerelease_2</td>
<td>Prerelease_2</td>
<td>SIGA-UM</td>
</tr>
</tbody>
</table>

*The addresses in Table 2-3 demonstrate the importance of ensuring that the SIGA-REL occupies six consecutive addresses. The actual addresses in your system may differ.

Programming an AND group

AND groups function as cross zones. For more information about programming AND groups, see the EST2 System Programming Manual and the 2-SDU Help.

Note: Every device contained in each (SIGA-REL) AND group must include a rule with an output statement like the one in [ALARM1]. See Figure 2-1 for the details.

Reconciling the Signature map

Caution! Do not use Accept Actual in the Signature Series mapping tool. Accepted devices may appear as two devices in the SDC database and corrupt it. Use the Break Chain and Commit Expected functions to reconcile the Signature map.

Writing rules for the SIGA-REL

To write the rules:

1. In the Rules Editor, write the mandatory rules in Figure 2-1 and the optional rules in Figure 2-2.
2. Compile the rules and run the required conversions.
3. Download and upload the new information.
Note: See the system testing section, at the end of this chapter, before you test of your system.

```
(ALARM1)
ALARM 'ALARM_1': ON 'PRERELEASE_1';

(ALARM2)
ALARM 'ALARM_2': ON 'PRERELEASE_1';

(RELEASE)

CONFIRMATION 'PRERELEASE_1': ON 'LED_1_1';

(LED2)
CONFIRMATION 'RELEASE_1': ON 'LED_1_2';
```

**Figure 2-2: Optional rules for the SIGA-REL**

Avoid using the Drill switch to test the SIGA-REL. If you activate a Drill, press the Reset switch to deactivate it. The deactivation of the Drill switch, alone, will not silence the prerelease tones.

Note: [ALARM_1] and [ALARM_2] require the addition of two Signature Series alarm devices to the SDC Configuration. Make sure that the object labels in the rules match the labels assigned in the Object Configuration.

Note: [LED1] and [LED2] require the addition of an LED module to the MCM Configuration. Make sure that the labels for the LEDs match the labels assigned to them in the Object Configuration.
Adding the SIGA-REL to the database

**Warning!** This information was prepared for users who are proficient in every aspect of 3-SDU (Revision 1.5) programming. DO NOT attempt to program the SIGA-REL if your certification is not current. Failure to do this may result in loss of life, serious injury, or property damage.

**Caution!** If you are adding other Signature Series devices to the project database, add the SIGA-REL last. Adding devices after the SIGA-REL may disrupt the addressing scheme. The SIGA-REL is a single module with six serial numbers, but the 3-SDU (Revision 1.5) recognizes it as three SIGA-UMs. Addresses will differ for each installation, but they must be consecutive.

The SIGA-REL provides only one serial number label. When you scan in the SIGA-REL, only the first two serial numbers will appear in the database.

**To add the SIGA-REL to the database:**

1. Scan in the SIGA-REL serial number label.
2. In the DSDC configuration (Loop X Modules tab), ensure that four blank addresses follow the first two addresses.
3. Add two more SIGA-UMs (four address spaces) to the database to fill in the four empty addresses.
4. In the Signature Series mapping tool, access the Actual vs. Expected Data dialog box (F9 key).
5. Click Break Chain and select the appropriate address.
6. Commit the expected data.
7. In the DSDC configuration, configure the SIGA-REL (SIGA-UM) addresses in strict accordance with Tables 2-4 and 2-5.
Caution! Do not use the Accept Actual function in the Signature Mapping tool. Accepted data may corrupt the database by causing it to see every device as two devices.

Warning! DO NOT configure the third and fifth SIGA-UM addresses as common outputs or audio amplifiers. Any off-normal condition will activate the automatic release sequence if these addresses are common outputs. The Drill switch will activate the prerelease and the release circuits if they are audio amplifiers. You must select the device types and personality codes exactly as prescribed in Tables 2-4 and 2-5.

<td>130*</td>
<td>Prerelease_1</td>
<td>Prerelease_1</td>
<td>SIGA-UM</td>
</tr>
<tr>
<td>None</td>
<td>131*</td>
<td>Prerelease_2</td>
<td>Prerelease_2</td>
<td>SIGA-UM</td>
</tr>
</tbody>
</table>

*The addresses in Table 2-6 demonstrate the importance of ensuring that the SIGA-REL occupies six consecutive addresses. The actual addresses in your system may differ.

Programming an AND group

AND groups function as cross zones; matrix groups function as counting zones. For more information about programming AND groups and matrix groups, see the *EST3 System Programming Manual* and the *3-SDU Help*.

**Note:** Every device contained in each (SIGA-REL) AND group must include a rule with an output statement like the one in [ALARM1]. See Figure 2-3 for the details.

**Warning!** Set the AND group to an Activate number 2 or greater. Activate number 1 will cause the AND group to become an OR group, and any activation of Alarm_1 or Alarm_2 will activate the release sequence.

**Note:** For preaction operation, set the Activate number to 1. This will cause the AND group to become an OR group. Any activation of Alarm_1 or Alarm_2 will then activate the release sequence.
Reconciling the Signature map

**Caution!** Do not use `Accept Actual` in the Signature Series mapping tool. Accepted devices may appear as two devices in the SDC database and corrupt it. Use the `Break Chain` and `Commit Expected` functions to reconcile the Signature map.

Writing rules for the SIGA-REL

**To write the rules:**

1. In the Rules Editor, write the mandatory rules in Figure 2-3 and the optional rules in Figure 2-4.
2. Compile the rules and run the required conversions.
3. Download and upload the new information.

**Note:** See the system testing section, at the end of this chapter, before you test your system.

---

**Figure 2-3: Mandatory rules for the SIGA-REL**

```
[ALARM1]
ALARM 'ALARM_1' : ON 'PRERELEASE_1';
[ALARM2]
ALARM 'ALARM_2' : ON 'PRERELEASE_1';

ON 'RELEASE_1',
DLYR 10;
[DUMP]
ALARM 'MANUAL' : ON ~HIGH 'RELEASE_1';
```

**Note:** [ALARM_1] and [ALARM_2] require the addition of alarm devices to the panel configuration. Make sure that the object labels match the labels assigned to them in the Object Configuration.

---

**Figure 2-4: Optional rules for the SIGA-REL**

```
[DRILL]
DRILL : ON 'PRERELEASE_1';
[LED1]
RLYCFG 'PRERELEASE_1' : ON 'LED_1_1';
[LED2]
RLYCFG 'RELEASE_1' : ON 'LED_1_2';
```

**Note:** [LED1] and [LED2] require the addition of an LED module to the Cabinet Configuration (Modules tab, operator layer). Make sure that the labels for the LEDs match the labels assigned to them in the Object Configuration.

---

Avoid using the Drill switch to test the SIGA-REL. If you activate a Drill, press the Reset switch before you deactivate it. The deactivation of the Drill switch, alone, will not silence the prerelease tones.
Adding the SIGA-REL to the database

Warning! This information was prepared for users who are proficient in every aspect of 3-SDU (Revision 2.0) programming. DO NOT attempt to program the SIGA-REL if your certification is not current. Failure to do this may result in loss of life, serious injury, or property damage.

Caution! If you are adding other Signature Series devices to the project database, add the SIGA-REL last. Adding devices after the SIGA-REL may disrupt the addressing scheme. The SIGA-REL is a single module with six serial numbers, but the 3-SDU (Revision 2.0) recognizes it as three SIGA-RELs. Addresses will differ for each installation, but they must be consecutive.

The SIGA-REL provides only one serial number label. When you scan in the SIGA-REL, only the first two serial numbers will appear in the database.

To add the SIGA-REL to the database:

1. Scan in the SIGA-REL serial number label.
2. In the DSDC configuration (Loop X Modules tab), ensure that four blank addresses follow the first two addresses.
3. Add two more SIGA-RELs (four address spaces) to the database to fill in the four empty addresses.
4. In the Signature Series mapping tool, access the Actual vs. Expected Data dialog box (F9 key).
5. Click Break Chain and select the appropriate address.
6. Commit the expected data.
7. In the DSDC configuration, configure the SIGA-REL addresses in strict accordance with Tables 2-7 and 2-8.
Programming the SIGA-REL

Caution! Do not use the Accept Actual function in the Signature Mapping tool. Accepted data may corrupt the database by causing it to see every device as two devices.

Warning! DO NOT configure the third and fifth SIGA-REL addresses as common outputs or audio amplifiers. Any off-normal condition will activate the automatic release sequence if these addresses are common outputs. The Drill switch will activate the prerelease and the release circuits if they are audio amplifiers. You must select the device types and personality codes exactly as prescribed in Tables 2-7 and 2-8.

<td>Prerelease_2</td>
<td>SIGA-REL</td>
</tr>
</tbody>
</table>

*The addresses in Table 2-9 demonstrate the importance of ensuring that the SIGA-REL occupies six consecutive addresses. The actual addresses in your system may differ.

Programming an AND group

AND groups function as cross zones; matrix groups function as counting zones. For more information about programming AND groups and matrix groups, see the EST3 System Programming Manual and the 3-SDU Help.

Note: Every device contained in each (SIGA-REL) AND group must include a rule with an output statement like the one in [ALARM1]. See Figure 2-5 for the details.

Warning! Set the AND group to an Activate number 2 or greater. Activate number 1 will cause the AND group to become an OR group, and any activation of Alarm_1 or Alarm_2 will activate the release sequence. Check only Q1 for each device in the listbox labeled “Devices in Selected Group.” For Q1, only a detector in alarm will count as a device activation. If you check Q2, Q3, or Q4 the release circuit may accidentally activate for maintenance issues.

Note: For preaction operation, set the Activate number to 1. This will cause the AND group to become an OR group. Any activation of Alarm_1 or Alarm_2 will then activate the release sequence.
Reconciling the Signature map

**Caution!** Do not use *Accept Actual* in the Signature Series mapping tool. Accepted devices may appear as two devices in the SDC database and corrupt it. Use the *Break Chain* and *Commit Expected* functions to reconcile the Signature map.

Writing rules for the SIGA-REL

**To write the rules:**

1. In the Rules Editor, write the mandatory rules in Figure 2-5 and the optional rules in Figure 2-6.
2. Compile the rules and run the required conversions.
3. Download and upload the new information.

**Note:** See the system testing section, at the end of this chapter, before you test of your system.

---

**Figure 2-5: Mandatory rules for the SIGA-REL**

```
[ALARM1]
ALARM 'ALARM_1' : ON 'PRERELEASE_1';

[ALARM2]
ALARM 'ALARM_2' : ON 'PRERELEASE_1';

[ANDGROUP DUMP]
ALARM 'AND_GROUP1' : DLYA 10,
ON 'RELEASE_1',
DLYR 10;

[DUMP]
ALARM 'MANUAL' : ON -HIGH 'RELEASE_1';
```

**Note:** [ALARM_1] and [ALARM_2] require the addition of alarm devices to the panel configuration. Make sure that the object labels match the labels assigned to them in the Object Configuration.

---

**Figure 2-6: Optional rules for the SIGA-REL**

```
[DRILL]
DRILL : ON 'PRERELEASE_1';

[LED1]
RLYCFG 'PRERELEASE_1': ON 'LED_1_1';

[LED2]
RLYCFG 'RELEASE_1': ON 'LED_1_2';
```

**Note:** [LED1] and [LED2] require the addition of an LED module to the Cabinet Configuration (Modules tab, operator layer). Make sure that the labels for the LEDs match the labels assigned to them in the Object Configuration.

---

Avoid using the Drill switch to test the SIGA-REL. If you activate a Drill, press the Reset switch before you deactivate it. The deactivation of the Drill switch, alone, will not silence the prerelease tones.
System testing

Warning! Disconnect the release circuit until system testing is complete and the system is stable.

Testing EST2 systems
Allow the system sufficient time to stabilize after the initial startup or download. Before you test the system, access the SDC Status tool in the 2-SDU. Do not test the system if the status LEDs indicate anything pending or in progress. This includes:

• Mapping
• Device new starts
• Resets
• Restarts

Testing EST3 systems
Allow the system sufficient time to stabilize after the initial startup or download. Before you test the system, access the DSDC Status tool in the 3-SDU. Do not test the system if the status LEDs indicate anything pending or in progress. This includes:

• Mapping
• Device new starts
• Resets
• Restarts

In the 3-SDU (Rev 2.0), you can test the system while the Device Supervision LED is on. The Device Supervision LED may be on longer for larger loops.
Chapter 3

Operational description

Summary
The SIGA-REL works with manual and automatic inputs. The operational description explains how the SIGA-REL fits into the fire alarm system and behaves during fire alarms.

Content
Integrating the Releasing Module with fire alarm systems • 3.2
  System overview • 3.2
  Preaction/deluge sprinkler systems • 3.2
  Automatic fire extinguishing systems • 3.3
Developing a fire suppression plan • 3.4
Releasing fire suppression agents • 3.5
  Understanding the automatic release sequence • 3.5
  Initiating manual releases • 3.6
Integrating the Releasing Module with fire alarm systems

System overview

The SIGA-REL is a Signature Series module that interfaces a Signature loop controller with fire suppression components. The Releasing Module works with sprinkler systems and automatic extinguishing systems. Sprinklers include preaction and deluge systems. Automatic fire extinguishing systems include the fire suppression agents listed in Table 1-2.

Note: See Installing the SIGA-REL for details about its wiring, specifications, mounting, and abort mode settings. For wiring resistance calculations, see pages 1.7 and 1.8.

Preaction/deluge sprinkler systems

Figure 3-1 illustrates the integration of the SIGA-REL with the fire alarm control panel and a preaction or deluge sprinkler system. Sprinkler systems do not include service disconnect stations, abort stations, or manual release stations.

Figure 3-1: Integration of the Releasing Module with a deluge or preaction sprinkler system
Automatic fire extinguishing systems

The SIGA-REL also supports automatic extinguishing systems, which provide manual actuation of abort, release, and service-disconnect functions. Figure 3-2 illustrates the integration of the SIGA-REL with a fire alarm control panel in an automatic fire extinguishing system.

Figure 3-2: Integration of the Releasing Module with an automatic extinguishing system
Developing a fire suppression plan

The Releasing Module consists of two releasing circuits, which provide fire suppression in two separate areas. The computer room illustrated in Figure 3-3 is a typical application for the Releasing Module.

Figure 3-3: Typical computer room application
Releasing fire suppression agents

Understanding the automatic release sequence

The automatic release sequence requires an AND group (cross zone) or a matrix group (counting zone). AND groups and matrix groups require fire alarm signals from designated Signature Series devices. These logic groups are programmable through a laptop computer and the System Definition Utility (SDU). Figure 3-4 explains the automatic release sequence.

Note: EST2 systems do not support matrix groups. See Programming the SIGA-REL for AND group rules. To create AND groups and matrix groups, see the System Programming Manual and the SDU Online Help for your system.

Figure 3-4: Automatic release sequence

[1] A detector signals the first alarm. This event simultaneously activates the:
   - First alarm relay
   - Prerelease strobe circuit (steady On)
   - Prerelease horn circuit (15 pulses per minute)

[2] A detector in the protected area signals a second alarm and meets the AND group conditions. The automatic delay timer then starts its countdown and the prerelease horn circuit changes to 60 pulses per minute.

*AND group and matrix group conditions depend on programming.

[3] 10 seconds before the automatic delay timer expires, the prerelease (horn) circuit changes to steady On.

[5] A manual reset at the fire alarm control panel deactivates the release solenoids and the Releasing Module returns to the normal state.

Note: Prerelease circuit 1 supports audible notification appliances that sound prerelease and release signals. Audible prerelease signals sound at 15 and 60 pulses per minute. The audible release signal is a steady tone. Prerelease circuit 2 supports visual notification appliances.
Initiating manual releases

The operation of a manual release station initiates the manual release sequence. Figure 3-5 explains the manual release sequence.

Warning! You CANNOT abort the manual release sequence.

Figure 3-5: Manual release sequences

[1] An active manual release station disables automatic operation and the abort function and simultaneously activates the:
• Manual delay timer
• Prerelease circuit
• Prerelease strobe circuit (steady On)
• Prerelease horn circuit (60 pulses per minute)

[2] 10 seconds before the expiration of the manual delay timer, the pre-release horn changes from 60 pulses per minute to steady On.

[4] A manual reset at the fire alarm control panel deactivates the release solenoids and the Releasing Module returns to the normal state.
Chapter 4

SIGA-REL trouble indications

Summary
You may occasionally see SIGA-REL messages on the front panel display. Table 4-1 provides trouble indications for EST2 panels. Table 4-2 provides trouble indications for EST3 panels.

Content
SIGA-REL indications on EST2 panels • 4.2
SIGA-REL indications on EST3 panels • 4.4
SIGA-REL indications on EST2 panels

**Warning!** Disconnect all wiring on TB4 of the SIGA-REL (release circuits 1 and 2) during system service. Disabled points will not prevent activation of the release circuits. Failure to follow these instructions may result in loss of life, serious injury, or property damage.

After the successful completion of the programming process, the fire alarm control panel will reset itself. Upon reset, device supervision may cause the panel to generate a Dev/Line fault for each SIGA-REL circuit. This is a normal indication, and it should go away within minutes. Table 4-1 lists the indications you may see for the SIGA-REL on the 2-LCD.

SIGA-REL indications on EST3 panels

**Warning!** Disconnect all wiring on TB4 of the SIGA-REL (release circuits 1 and 2) during system service. Disabled points will not prevent activation of the release circuits. Failure to follow these instructions may result in loss of life, serious injury, or property damage.

When programming is complete, the fire alarm control panel will reset itself, reconstruct the line datacard, and map it. Upon reset, device supervision may cause the panel to generate a common trouble active for each SIGA-REL circuit. This is a normal indication, and it should go away within minutes. Table 4-2 lists the indications you may see for the SIGA-REL on the 3-LCD.
